Escape Game Brief

Summary

Players are in a rectangle arena (horizontal). 2D top-down view. They control a 'vessel'. This would change depending on theming. For this brief lets assume there's one theme and it's pirate themed. So players move a pirate ship around a screen. There is a cannon on edge of screen. Every x seconds, it shoots out a new small cannonball. This then perpetually flies around the map and bounces off the edges when it hits them. The goal is to avoid the cannonballs. If any hit your ship, it's game over.

Game could start with 4 cannonballs fired in quick succession to kick things off as avoiding 1 ball is quite easy. Then, 1 is added every x seconds. The longer a player survives, the more frequently they spawn.

The goal is to get the highest score. This could take into account time survived, powerups/downgrades picked up, 'gems' or similar picked up (perhaps randomly spawning, pick up for extra points) etc.

Powerups/downgrades to include speeding up/down the cannonballs, powerup to remove all cannonballs on the map, to speed up or slow down your ship move speed, double points for x seconds, increase/decrease size of all cannonballs for a certain time period etc.

In app purchases can be removing ads between games, purchasing map skins and themes.

I would also welcome your thoughts and ideas on this from the perspective of a game developer. Any ideas you have for features or improvements would be great.
